User Experience Feedback Report

miah.shop — Real user walkthrough across 8 key criteria
Findings, observations and prioritised recommendations

Prepared for Senior Management · April 2026 · Confidential

Executive Summary

This report presents the findings of a structured user experience (UX) review of miah.shop, conducted by walking through the website as a real customer across eight key areas. Each area was rated as Good, Needs Work, or Missing, with specific observations and recommended fixes.

1	7	0
Good	Needs Work	Missing

The review found that social media links are well implemented. However, 7 out of 8 areas require improvement. The three most critical issues — all requiring urgent attention — are mobile page speed (20+ seconds), absence of customer reviews, and no About page. These three alone are likely responsible for the majority of lost sales.

Key Strength

Social media links are correctly placed in the footer following standard web conventions, making them easy for visitors to find. This is the one area that meets expected standards.

Critical Weaknesses

Area	Issue	Business Impact
Mobile experience	20+ second load time on mobile	53% of visitors abandon pages taking over 3 seconds
Trust signals	No customer reviews, no About page	New visitors have no reason to trust and buy
Product pages	Descriptions block the product grid	Shoppers leave before seeing any products
Page speed	Slow on desktop too	Hurts Google ranking and reduces organic traffic

Detailed Findings — Area by Area

01. Homepage first impression	Needs Work	Impact: High
Observation:	The homepage has good visual content (video and images) but loading time is too slow. Visitors are made to wait before they can see anything, which causes frustration and early abandonment.	
Recommended fix:	Compress and lazy-load all homepage videos and images. Use a lightweight placeholder or skeleton screen while content loads. Consider replacing the autoplay video with a static hero image on first load.	

02. Navigation & menu structure	Needs Work	Impact: Medium
Observation:	Products are findable from the top menu, which is a positive. However, the menu lacks visual separation between categories and does not show category images, making it harder to browse quickly.	
Recommended fix:	Add horizontal dividers between menu sections and include a small thumbnail image for each product category. This is a standard practice on Uniqlo and Ralph Lauren and significantly improves discoverability.	

03. Product pages (photos, descriptions, sizing)	Needs Work	Impact: High
Observation:	On category pages, a long descriptive text block and banner image appear before the product grid, forcing customers to scroll before seeing any products. Shoppers want to see products immediately and make decisions from images, not text.	
Recommended fix:	Move the product grid to the very top of category pages. Relocate category descriptions to a collapsible section at the bottom, or a small "About this collection" toggle. Show products first, always.	

04. Trust signals (reviews, about page, contact info)	Needs Work	Impact: Critical
Observation:	There is no About page and no customer reviews anywhere on the site. These are the two most important trust signals for new visitors, especially on a niche fashion brand they are encountering for the first time.	
Recommended fix:	Create an About page telling the brand story (founder, cultural mission, craftsmanship). Add a customer reviews section to product pages. Even 5-10 genuine reviews make a significant difference to conversion rates.	

05. Checkout experience	Needs Work	Impact: Medium
Observation:	Quantity adjustment (increase/decrease) works in the cart, which is good. However, cancelling an order is difficult to find, which creates anxiety for customers who want to feel in control of their purchase.	
Recommended fix:	Add a clearly visible "Cancel order" or "Edit order" option in the order confirmation email and order history page. Make the returns and cancellation policy easy to find — ideally linked from the checkout page itself.	

06. Mobile experience	Needs Work	Impact: Critical
Observation:	The site takes over 20 seconds to load on mobile. This is a critical failure — industry research shows 53% of mobile visitors leave a page that takes longer than 3 seconds to load. This alone is likely costing significant sales.	
Recommended fix:	Urgent: compress all images to WebP format, enable browser caching, and use a Content Delivery Network (CDN). Remove or defer any heavy scripts. Target a mobile load time of under 3 seconds. This is the single most impactful technical fix available.	

07. Page speed	Needs Work	Impact: Critical
Observation:	Page loading is slower than acceptable on both desktop and mobile. Slow loading affects not just user experience but also Google search rankings — slow sites rank lower in search results, reducing organic traffic.	
Recommended fix:	Run the site through Google PageSpeed Insights (free tool) to get specific recommendations. Key fixes typically include: image compression, minifying CSS/JS files, enabling caching, and upgrading hosting if necessary.	

08. Social media links	Good	Impact: Low
Observation:	Social media links are visible and correctly placed in the footer, which follows standard web conventions. Visitors who scroll to the bottom can easily find and follow the brand on social platforms.	
Recommended fix:	Consider also adding social icons to the header or product pages to increase visibility. Embedding an Instagram feed on the homepage would add visual content and social proof simultaneously.	

Prioritised Action Plan

The following eight actions are ordered by urgency and business impact. The first three are critical and should be addressed within the next 30 days. Items 4–5 should follow within 60 days. Items 6–8 can be planned for the next quarter.

Days 1–30 Items 1, 2, 3 — Critical fixes	Days 31–60 Items 4, 5 — High priority improvements	Days 61–90 Items 6, 7, 8 — Medium/low enhancements

1 **Fix mobile page speed (20+ second load time)** — CRITICAL
Critical — Compress images to WebP, use a CDN, defer heavy scripts. Target under 3 seconds on mobile.

2 **Add customer reviews to product pages** — CRITICAL
Critical — Even 5-10 reviews dramatically increase new visitor confidence and conversion rates.

3 **Create an About page** — CRITICAL
Critical — New visitors need to understand who Brad Miah is and why they should trust this brand.

4 **Move products to the top of category pages** — HIGH
High — Remove the description block from above the product grid. Customers decide from images, not text.

5 **Fix desktop page speed** — HIGH
High — Run Google PageSpeed Insights and action the top recommendations to improve load time and SEO.

6 **Improve navigation with category images & dividers** — MEDIUM
Medium — Add thumbnail images per category and horizontal dividers in the top menu.

7 **Make order cancellation easy to find** — MEDIUM
Medium — Link clearly to the cancellation/returns policy from cart, checkout, and order confirmation.

8 **Embed Instagram feed on homepage** — LOW
Low — Turns static social links into live social proof and adds fresh visual content automatically.

Conclusion

miah.shop has strong foundations — a clear brand identity, visible social media presence, and a product range that serves a genuine niche. However, the site is currently losing customers at nearly every stage of the journey due to slow loading, lack of trust signals, and UX friction on category pages. The good news is that all of these are fixable. Addressing the three critical items — mobile speed, customer reviews, and an About page — will have an immediate and measurable impact on conversion and customer confidence.

User review conducted April 2026. Findings based on a structured walkthrough of miah.shop across 8 UX criteria. For internal management use only.
