Comparative analysis of miah.shop Vs user.miahbd.com

This section shows comparative analysis of miah.shop Vs user.miahbd.com identified while interacting with the two versions of websites of Miah Brand as a user, highlighting both strengths and weaknesses.

1 Performance & Loading Speed

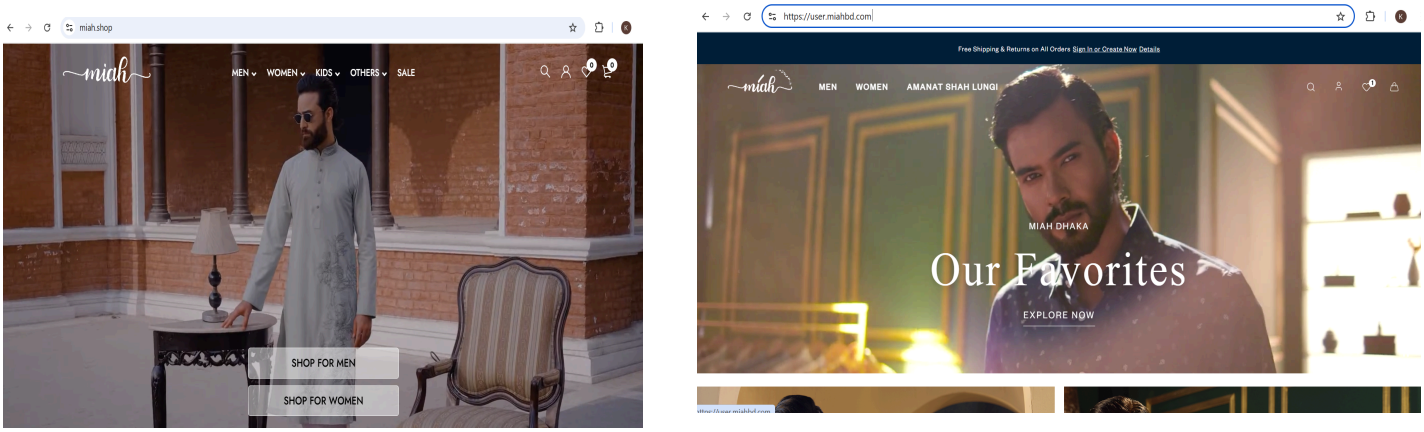

Figure 1: Homepage Loading View of miah.shop vs user.miahbd.com

Observation:

The user.miahbd.com loads noticeably faster than miah.shop.

- **user.miahbd.com:**
  - Faster initial load time
  - Lightweight interface with fewer heavy assets
  - Content appears quickly, even on slower connections
- **miah.shop:**
  - Slower initial load (likely due to images, banners, or richer UI elements)
  - Delay before meaningful content is visible

User Impact:

- Faster load time on user.miahbd.com creates a **smoother and more responsive experience**
- Slower performance on miah.shop may:
  - Increase bounce rate

- Reduce engagement
- Frustrate mobile users (especially on low bandwidth)

This is particularly important in regions like Bangladesh where many users rely on **mobile data and variable network speeds**

Business Impact:

- Faster websites → higher retention and conversion
- Slower load times → potential loss of first-time users

Key Insight:

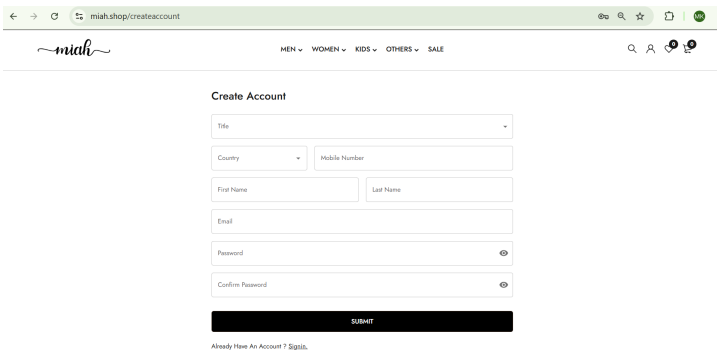

> While miah.shop offers a richer visual experience, it sacrifices performance, whereas user.miahbd.com prioritizes speed but lacks visual depth.

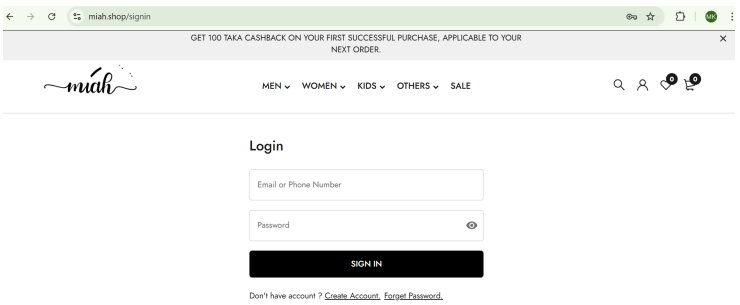

Recommendation:

- Optimize miah.shop performance by:
  - Compressing and lazy-loading images
  - Reducing unnecessary scripts
  - Using optimized assets
- Maintain speed advantage of user.miahbd.com while improving UI quality
- For unified platform:

---

2 Quick Sign-In Options (Social Login)

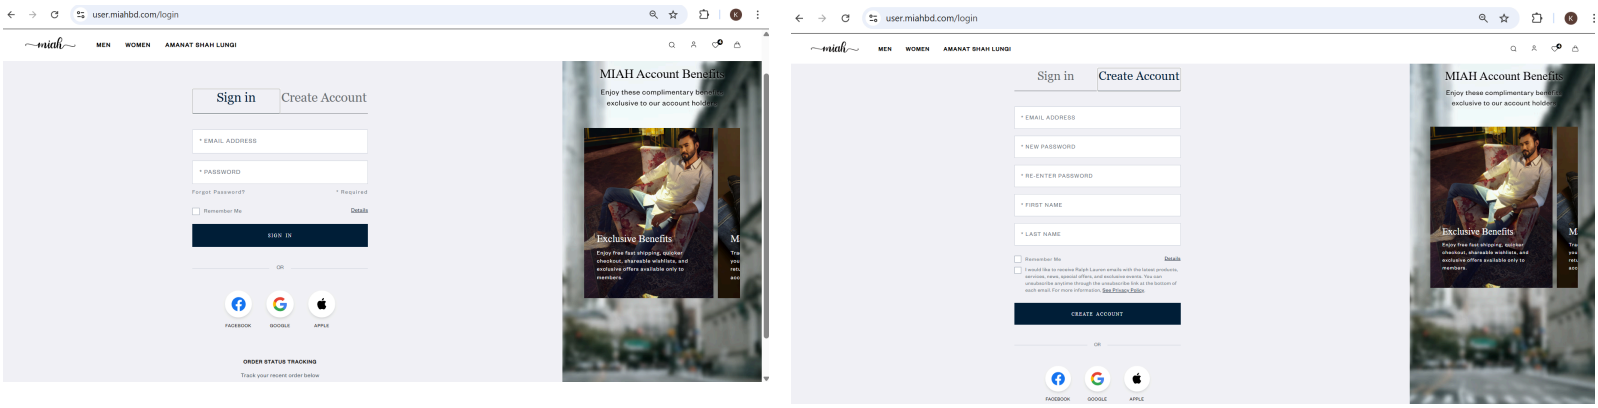

Figure 2: Login and Account Creation Comparison between miah.shop and user.miahbd.com

Observation:

The user.miahbd.com platform provides multiple **quick sign-in options**, including:

- Google
- Facebook
- Apple

In contrast, miah.shop does not offer social or one-click login options and relies on traditional login/signup methods.

User Impact:

- Social login significantly reduces **time and effort** required for account creation
- Eliminates the need to remember new passwords
- Creates a smoother and faster onboarding experience

Users are more likely to:

- Complete registration
- Log in frequently
- Avoid drop-off during signup

Business Impact:

- Higher **conversion rate** during signup
- Increased **user retention**

- Reduced friction in onboarding → more active users

Key Insight:

> user.miahbd.com lowers the barrier to entry with fast, convenient login methods, while miah.shop introduces friction by requiring manual account creation.

Recommendation:

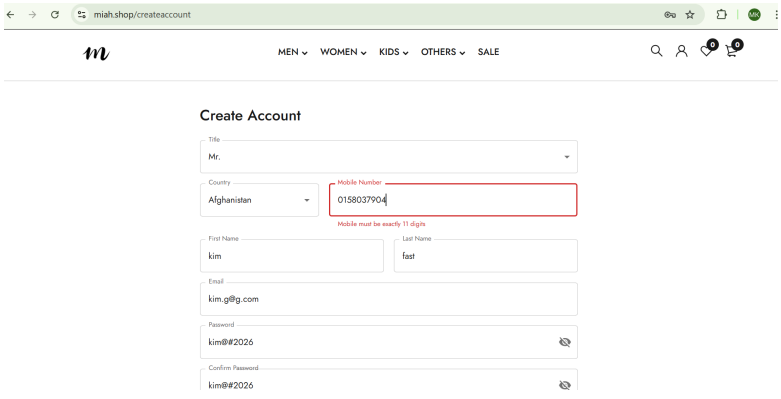

- Integrate **social login options** (Google, Facebook, Apple) into miah.shop
- Standardize login experience across both platforms
- For unified platform:

Additional Suggestion:

- Clearly display social login buttons at the top of the login form
- Add trust indicators (e.g., “Secure login via Google”) to increase confidence

---

3 Phone Number Validation & Input Experience

Observation:

- miah.shop enforces a strict **11-digit phone number validation**, tailored for Bangladesh numbers.
    - However, it does **not include a country code (+880)**
    - No auto-formatting or guidance is provided
- user.miahbd.com has **no clear validation rules** for phone numbers. (I did not find it today. No phone number options)
    - Users can input inconsistent or incorrect formats

User Impact:

- On miah.shop:
    - Users may be confused about required format
    - International or unfamiliar users may face difficulty
    - Lack of country code reduces clarity
- On user.miahbd.com:
    - No validation can lead to incorrect data entry
    - Users may not realize mistakes until later

Overall:

- Inconsistent input experience across platforms creates confusion and reduces trust

Business Impact:

- Incorrect or inconsistent phone numbers can:
    - Break communication (OTP, delivery, support)
    - Increase failed transactions or delivery issues
    - Reduce data reliability

Key Insight:

> miah.shop enforces validation but lacks usability, while user.miahbd.com allows flexibility but sacrifices data accuracy. Neither provides a complete, user-friendly solution.

Recommendation:

- Implement a **standardized phone input system** across both platforms:
    - Auto-detect and display **country code (+880)**
    - Use a dropdown for country selection (default: Bangladesh)
    - Apply real-time validation with clear error messages
    - Format input automatically (e.g., +880 1XXXXXXXXX)

- For unified platform:

  Combine **strict validation (accuracy)** with **user-friendly input guidance (usability)**

Additional Suggestion:

- Show example format inside input field (e.g., “+880 1XXXXXXXXX”)
- Provide instant feedback (✔ valid / ✖ invalid)
